

(a) : Given: $m = 100 \text{ g}$, $u = 20 \text{ m/s}$, $\theta = 60^\circ$

Velocity at highest point, $u_x = u \cos 60^\circ$

$$\text{K.E}_i = \frac{1}{2} m u^2$$

$$\text{K.E}_f = \frac{1}{2} m (u \cos 60^\circ)^2$$

Change in kinetic energy, $\Delta K.E = K.E_i - K.E_f$

$$\Delta K.E = \frac{1}{2} m u^2 [1 - \cos^2 60^\circ] = \frac{1}{2} \times \frac{100}{1000} \times 20 \times 20 \times \frac{3}{4}$$

$$\Delta K.E = 15 \text{ J}$$
